

12/16 JN-AN-1174 を参考

- ・ coordinatorTerminal で“send” を打ち込むと“FromCoordinator”が両方の Terminal で表示できるようにする.

- ・ Enddevice も同様に“FromEnddevice” と表示できるようにする.

なので, Terminal では接続後, 何も表示されずに command(send)入力を待機しているようにしておく.

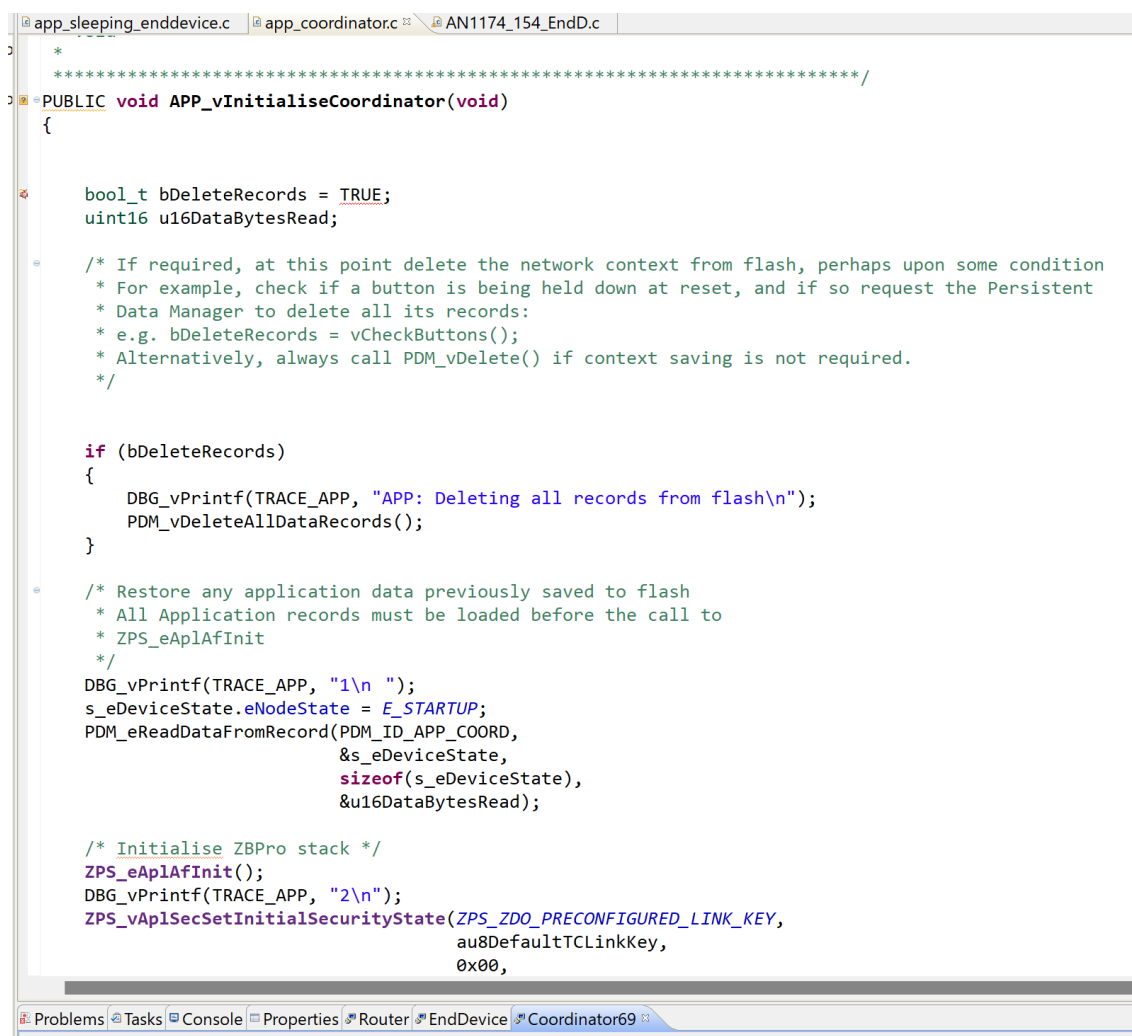

○Coordinator のコードを追加・変更を行う.

初期化を行う関数に terminal からの文字入力を読み取るコードを追加.

入力文字を terminal から読み込んで MONOSTICK(Coordinator)に送信する経路を意味する UART は起動して最初に実行される初期化関数 initialize に記述する.

Loop 関数と平行して UART は動作する.

文字を入力すると UART のバッファに保存され, send+enter キーが入力されると, Loop 関数にある Command で処理される.

```

```

Makefile に Utils.c を追加することで、エラーは解消した。

DBG_vPrintf("1 ¥n"); など入れても、terminal に何も表示されない。

```
vHandleStackEvent(sStackEvent);
DBG_vPrintf(TRACE_APP, "vReadkey¥n");
vReadkey(); //キーボードからの入力を読み取る
```

このようにすると、vReadkey が表示されたので、キーボードからの文字を読み取っていないか、入力された文字を判別できていないか。

今まではブロードキャスト通信だったので、シリアル通信をするためにアドレスを取得する関数を使って、Enddevice のアドレス取得をした。

[Re: Using BeyondStudio for NXP JN5169 I can't seem... - NXP Community](#)

ZPS_u64AplZdoGetIeeeAddr

`uint64 ZPS_u64AplZdoGetIeeeAddr(void);`

Description

This function obtains the 64-bit IEEE (MAC) address of the local node.

Parameters

None

Returns

64-bit IEEE/MAC address obtained

Enddevice に追加したコード

```
uint64 mac;  
mac = ZPS_u64AplZdoGetIeeeAddr();  
DBG_vPrintf(TRUE, "0x%04x%04x\n", mac);
```

実行結果では, 0x1bc501 が表示された.

```
uint64 mac64=ZPS_u64AplZdoGetIeeeAddr();  
uint32 mac32h=(uint32)(mac64>>32);  
uint32 mac32l=(uint32)(mac64<<32);  
DBG_vPrintf(TRUE, "mac64=0x%04X%04X\n", mac32h, mac32l);
```

実行結果は, mac63=0xXX が表示された.

今後の予定

- ① Coordinator と Enddevice のアドレスを調べて, シリアル通信を構築する.
- ② Router を追加してマルチホップ通信にする.この時もシリアル通信で行う.
 - 1) Coordinator から Router に, send コマンドと Enddevice のアドレスを送信
 - 2) Router が宛先である Enddevice に送信する.
 - 3) Enddevice は受信後, 送信元の Coordinator(source)のアドレスをデータと共に得ているので, Router にそのアドレスと ACK データを送信する.
 - 4) Router はそのアドレスを見て, Coordinator に送信する.
